Abstract: Trust is a significant factor that influences consumers' online purchase intentions. This paper performed a meta-analysis to investigate the influence of trust on purchase intention in the online shopping context. It also examines this relationship for the effect of the factors such as trust type (trust in website and trust in e-retailers) and types of purchase decision (initial purchase intention and repeat purchase intention). The meta-analysis of 25 selected studies found that trust and online purchase intention are positively related. The study results also show that the type of trust intention does not affect this relationship. Both trust in websites and trust in e-retailers have a positive influence on online purchase intention. Further, the relationship results did not change irrespective of online purchase type: purchase intention or repeat purchase intention. In cases, trust and purchase intention relationships are positive.

Keywords: review; trust; online shopping; purchase decision; purchase intention; repeat purchase intention; systematic review, meta-analysis.

1 Introduction

Trust is an important antecedent in the online shopping context for a long-term relationship between buyers and sellers. They are physically distanced from each other (Anderson and Weitz, 1989). "Trust is defined as the general belief that another party can be trusted, based on the assumption that the other party in the social exchange will not act opportunistically but will behave in an ethical and socially appropriate manner" (Gefen et al., 2003b; Salloum and Al-Emran, 2018). "It is a combination of particular beliefs such integrity, benevolence and competence. It is once expected that the opposite party will behave in a particular way that is important to us" (Allen and Wilson, 2003; Abdullah and Siraj, 2018). According to McKnight et al. (2002), consumers are concerned about their security and privacy while online shopping, which can be overcome by providing a trustworthy online shopping environment. As per the study by Chen and Barnes (2007), a lack of trust in online shopping will lower consumers' desire for online purchases. Consumers will trust only those e-retailers who are ready to set norms and policies that safeguard them from antitrust activities (Pavlou and Gefen, 2004). Therefore, trust is an essential predictor of online purchase intention (Çelik and Yilmaz, 2011; Tandon and Kiran, 2018).

Trust has been conceptualised and empirically tested as an essential determinant in many prior studies. Majorly, previous literature has studied trust from two perspectives: Trust in websites and trust in e-retailers (Mou and Cohen, 2016). The first perspective, trust in website, "It is the willingness of consumers to depend on the online platform to perform transactions", is considered as a significant antecedent to online purchase intention (Lu et al., 2010). Consumers are less likely to purchase online if they perceive e-retailers' websites as less trustworthy (Jarvenpaa et al., 1999; Kim et al., 2008). Consumers consider an unfamiliar website as riskier and unlikely to be involved in online transactions (Hsu et al., 2014). The second perspective, "trust in e-retailers is the consumer's belief that online retailer is ethical, honest and consistent in delivering best quality products and services" (Fang et al., 2014). It reflects a customer's confidence in an e-retailer who can offer quality products and services to shoppers (Jarvenpaa et al., 1999). Trust in e-retailers reduces consumers' perceived risk while online shopping and influences online shopping intention (Liu and Tang, 2018). Therefore, both trust types play an important role in determining online purchase intention (Hong and Cho, 2011).

Trust is considered an essential element of online shopping for both types of customers: first-time shoppers and experienced shoppers (Gefen et al., 2008). Further, According to Gefen et al. (2003a), online purchase experience is a significant factor in determining the effect of trust on purchase intention. For the experienced online shopper, gradually, the importance and influence of trust decrease in determining online purchase decisions (Gefen et al., 2008). After repeat online purchase transactions, trust does not substantially affect online purchase intention (Heijden et al., 2003). Therefore, trust influences differently in the case of both initial and repeat online purchase intention. Thus, the study aims to investigate the relationship and influence of trust on both types of purchase intentions.

Many previous studies independently researched the effect of trust on online purchase intention. There is a positive association between trust and online purchase intention (Tarhini et al., 2018; Rahman et al., 2020; Ha et al., 2021). However, review of recent Meta-analysis studies is found that there is a gap in a meta-analysis-based investigation of the relationship between trust and online purchase intention. Nam et al. (2014)

investigated a meta-analysis of factors affecting purchase intention in e-commerce. In this study, an analysis of 114 research articles published in Korean journals revealed that the coefficient between trust and purchase intention was the largest, followed by the other variables such as commitment, values, loyalty, attitude, and satisfaction. Kim and Peterson (2017) performed a meta-analysis on online trust relationships in e-commerce, considering antecedents of trust such as perceived privacy and perceived service quality and consequences of trust such as loyalty, and repeat purchase intention. This study found that all consequences were positively associated with trust but provided a limited explanation of trust and the online purchase intention relationship. Another study was conducted by Sarkar et al. (2020) on antecedents and consequences of trust in mobile commerce. The study found that loyalty, user satisfaction, attitude, and behavioural intention positively related to trust in mobile commerce and provided effects size of all consequences. Ismagilova et al. (2020) investigated the relationship between electronic word-of-mouth communication and intention to buy based on 69 research articles. With 20 antecedents, this study considered trust in massage, emotional trust, and source trustworthiness as an antecedent to the intention to buy.

The above discussed recent meta-analysis studies were detailed in nature to explain the relationship between multiple antecedents of online purchase intention however provide a limited explanation of the relationship between trust as an antecedent of online purchase intention. Further, as per the recent review of the literature up to 2021, it is found that none of the studies have performed meta-analysis only on these two variables; trust and online purchase intention. Therefore, the availability of limited research in the context of a comprehensive investigation of the relationship between online purchase intention and trust through meta-analysis was the motivation to write this paper. Further, it is also crucial to understand this relationship by types of trust (trust in website and trust in e-retailer) and purchase decision types (repeat purchase intention and initial purchase intention). Hence, the study aims to develop a meta-analytical comprehensive synthesis of the effect of trust on online shopping intention considering both types of trust and type of online purchase intention.

2 Literature review

2.1 Trust and online purchase intention

"Trust is a perceived belief that the e-retailers will deliver its transactional obligations" (Agag and El-Masry, 2016). There was sufficient evidence in previous research that studied trust and its effect on online purchase intention. These studies empirically tested and proved that trust positively influences online purchase intention (Gong et al., 2019; Gefen et al., 2003b). Further, Rita et al. (2019) found that a satisfactory online purchase experience increases consumers' trust and will be more likely to perform repeat purchases. If the buyer does not have any prior direct interaction with an e-retailer, they perceive a higher risk and their level of trust is less towards online transition (Verhagen et al., 2006). However, trust becomes a significant influencing factor in the initial online purchase because consumers are unfamiliar with the online shopping experience with the e-retailers. Therefore, in an initial online purchase transaction, trust is assumed to substantially influence purchase intention (Kim et al., 2012). Whereas, in a repeat purchase transaction, consumers become familiar and have built a level of trust towards

retailers. Therefore, the influence of trust on purchase intention would be less in the case of online repeat purchases. The previous studies (Gefen et al., 2003a; Kim et al., 2009) posited that trust is more crucial for consumers in determining first purchase intention than repurchase intention. However, According to Gefen et al. (2008), trust is a significant determinant for all consumers, irrespective of their online shopping experience. Therefore, it is important to study the influence of trust on purchase intention type, i.e., initial and repeat purchases.

Trust can be understood from four perspectives (Hsu et al., 2014). Trust in website (Pavlou and Gefen, 2004; Lu et al., 2010), Trust in e-retailer (Jarvenpaa et al., 1999), Trust in- group members (Lu et al., 2010) and trust in the auction's initiator (Kauffman et al., 2010). Majorly, previous literature has studied trust from two perspectives: trust in website and trust in e-retailers (Mou and Cohen, 2016). The first perspective of trust, trust in website, "it is the willingness of consumers to depend on the online platform to perform transactions", is considered a significant antecedent to online purchase intention (Lu et al., 2010). The second perspective of trust, "trust in e-retailers is the consumer's belief that online retailer is ethical, honest and consistent in delivering best quality products and services" (Fang et al., 2014). Previous studies empirically confirmed that both trust in website and trust in e-retailers affect online purchase intention (Kim and Ahn, 2007). According to Pavlou and Gefen (2004), providing a trustworthy and reliable environment for the website to the consumers will solve major trust-related problems of e-retailers. Hence, a trustable website may positively influence a consumer to buy even from an unfamiliar e-retailer.

Figure 1 Conceptual framework

Therefore, the study performed a meta-analysis to comprehend the effect of trust types on both initial and repeat online purchase intention. The conceptual framework depicted in Figure 1 was used for meta-analysis to answer the following questions:

- What is the strength of the relationship between types of trust and types of online purchase intention?
- Is this relationship identical across types of trust and types of online purchase intention?

3 Method

Meta-analysis requires well-defined criteria and protocol to determine inclusion and exclusion criteria to consider a study for meta-analysis.

Research articles that investigated the influence of trust on online purchase intention were considered for meta-analysis published during 2010–2021. The selection criteria for the research article were:

1 article reported the trust and online purchase results in quantitative terms with the sample size (n) and coefficient r (correlation coefficient)

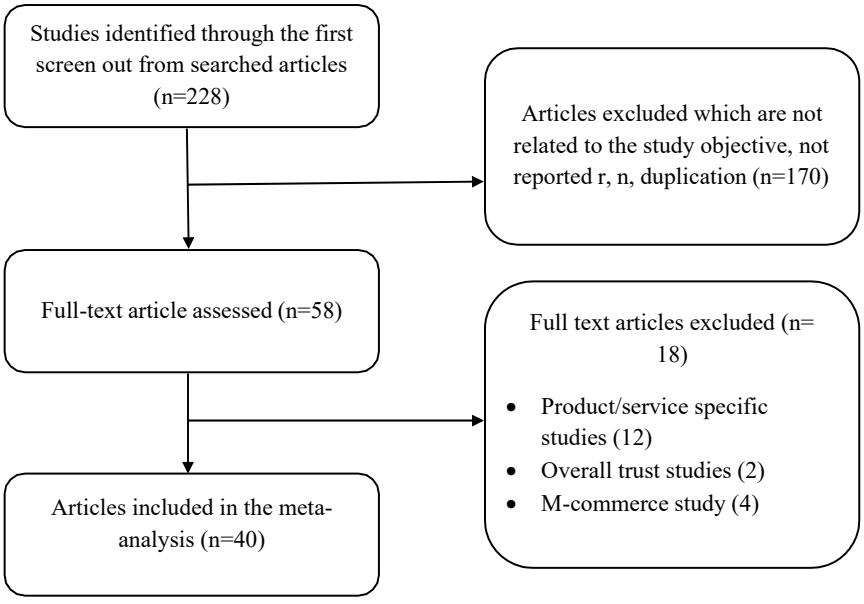

2 in the English language

3 published in peer-reviewed journals.

The studies without sample size and r were excluded from the consideration.

An online search was conducted. The online database such as ScienceDirect, Emerald Insights, Google Scholar, Scopus, IEEE, Inderscience, ProQuest, Taylor and Francis, and Web of Science were explored to search published articles for the meta-analysis. The search was based on the following keywords: trust AND online shopping intention; trust AND repeat purchase intention; trust AND continuance purchase intention; trust AND purchase intention; trust AND repurchase intention; trust AND online shopping; trust AND e-commerce OR B2C.

Figure 2 Flowchart of the process followed to include articles in the meta-analysis

The articles' initial search was in thousands that were further screened out by inclusion criteria to select a particular study. The study's title, abstract, and full text were screened out and finally ended with 228 studies that matched the meta-analysis requirements. In the indetermination of any study, both for inclusion and exclusion, the full text of that study was explored, and an independent researcher resolved conflicting opinions. Finally, 40 studies were decided to be considered for meta-analysis. These studies were investigated in detail, and information such as author, year of publication, research area (location), objective/s, product/service focus, types of trust, type of purchase behaviour, study context, sample size, sample characteristics extracted, and the same has been depicted in Table 1. Figure 2 shows the flow diagram of the process followed for the section of the studies in a meta-analysis.

4 Meta-analysis

Comprehensive meta-analysis (CMA) version 3 software was used to perform a meta-analysis to calculate the effect size. "Effect size is the weighted mean of an individual effect size of studies included in meta-analysis" (Borenstein et al., 2011). Effect size can be calculated either by the random effect model (REM) or fixed effect model (FEM). According to Borenstein et al. (2011), FEM assumes a single true effect in all studies under consideration in the meta-analysis. All the variance in the effect sizes is due to errors in sampling. In contrast, REM assumes that the real effect sizes may differ from research to research. This study used REM to measure effect size, heterogeneity analysis, and funnel plot.

4.1 Result: trust and online purchase intention

REM was applied to estimate the summary size of the overall influence of trust on online purchase intention. The heterogeneity test supported high heterogeneity across the study ($I^2 = 92.27$; $Q = 825.18$; $p = 0.000$). The overall correlation coefficient between trust and online purchase intention was ($r = 0.5588$) with a 95% confidence interval of 0.5099 to 0.6041. Overall, all 40 studies also reported a positive influence of trust on online shopping intention. However, a significant Q value supported that all studies do not share a common effect. A higher I^2 value indicated that variance is not due to sampling error but because of heterogeneity. The above statistics summary is depicted in Table 2 and Figure 3. The funnel plot is generally used in meta-analysis to assess publication bias. The funnel plot for the relationship between trust and online shopping reported no publication bias in the study data (Figure 4).

4.2 Result: trust and types of online purchase intention

Out of 40 studies, 26 investigated trust's influence on initial purchase intention. The effect size for these studies was $r = 0.5347$ ($p = 0.000$) with 0.47798 to 0.5870 confidence interval. Whereas remaining 14 studies investigated the influence of trust on repeat purchase intention. The effect size for these studies was $r = 0.6013$ ($p = 0.000$) with 0.5041 to 0.6834 confidence interval. The result summary of the meta-analysis depicted in Table 2 and Figure 5 indicated that trust is positively related to both types of online purchase intention.

4.3 Result: types of trust and online purchase intention

Out of 40 studies, thirty studies investigated the influence of trust in e-retailers on online purchase intention. The summary size for these studies was $r = 0.5662$ ($p = 0.000$) with 0.5075 to 0.6197 confidence interval. Whereas remaining ten studies investigated the influence of trust in website on online purchase intention. The summary size for these studies was $r = 0.5359$ ($p = 0.000$) with 0.4434 to 0.6171 confidence interval. The result summary of the meta-analysis in Table 2 and Figure 6 revealed that both types of trust were significantly and positively related to online purchase intention.

Table 2 The overall results of heterogeneity of 40 studies

5 Discussion and managerial implications

The previous meta analytical studies investigated the relationship between online purchase intention and its multiple antecedents (Nam et al., 2014; Kim and Peterson, 2017; Sarkar et al., 2020; Ismagilova et al., 2020). These studies provide mixed results about the relationship between trust as an antecedent of online purchase intention and provide a limited explanation of the effect of trust in the case of initial and repeat online purchase intention. The present study provides a synthesis of the relationship between trust and online purchase intention by gathering data from 40 empirical studies using a

meta-analysis approach and providing useful insights. The study revealed that trust has a significant relationship with online purchase intention. The overall effect size was strong (r = 0.5588; CI = 0.5099 to 0.6041). Further, the study also examined the effect of trust type (trust in e-retailers and trust in website) on online purchase intention. The result shows that trust in retailers and trust in website has a significant effect on online purchase intention. Although, the difference is less but the effect size of trust in retailer (r = 0.5662; CI = 0.5075 to 0.6197) is stronger than the effect size of the trust in website (r = 0.5359; CI = 0.4434 to 0.6171). Therefore, trust in retailers was a more significant antecedent for online purchases than trust in website. The study also examined the effect of types of purchase intention (initial purchase intention and repeat purchase intention) on the relationship between trust and purchase intention, and it is found that in case of both types of the purchase intention, trust has a significant effect on online purchase intention. Although, the effect was significant, in case of repeat purchase intention, its trust effect size (r = 0.6013; CI = 0.5041 to 0.6834) was stronger than the effect size (r = 0.5347; CI = 0.4779 to 0.5870) of trust with initial purchase intention.

The present study provides many implications for researchers and marketers. First, Previous Meta analytical studies provided the effect of trust on online purchase intention with other antecedents, and there were a limited number of studies focused on the one-to-one relationship between trust and online purchase intention. This study performed a meta-analysis of 40 empirical studies and synthesised the relationship between trust and online purchase intention. The results revealed that trust is positively associated with online purchase intention. Second, the study also found that types of trust wise and types of purchase intention wise, the relationship between trust and online purchase intention was significant, but the strength of the effect size varies for each relationship. The effect size of trust in retailers is stronger on online purchase intention than the effect size of trust in website. Whereas the effect size of trust is stronger in the case of repeat purchase intention as compared to initial purchase. This is the major contribution of the present study to the existing body of knowledge. The results will help researchers to develop more clarity about the relationship between trust and online purchase intention in their studies. Third, the study provides the theoretical framework for future research work in this area. The researchers can develop a conceptual model considering the effect size of each trust type and its impact on purchase intention. Fourth, the study theoretically contributes that trust in retailers is more strongly associated with online purchase intention. It also contributes to the significance of trust, and its effect is not reduced after an initial online purchase; instead of that, trust becomes more strongly associated with repeat online purchase intention.

The meta-analysis results provide important implications for marketers. It will help marketers to capitalise on the findings of this study to develop effective marketing strategies for their current and potential customers. First, according to the study findings, trust in e-retailers has a stronger effect on online purchase intention; therefore, online e-retailers should try to provide a transparent, reliable, and convenient online platform, which will enhance consumers' trust in websites. Second, there should be clear and well-defined policies and guidelines to be followed by the e-retailers to provide service to their customers as per their requirements which will enhance consumers' trust in e-retailers. It will increase trustworthiness towards e-retailers. Third, marketers should focus on increasing customer engagement with their website. Higher customer engagement rates will moderate the risk perception of customers towards e-retailers and websites and improve the trustworthiness of e-retailers. It can be achieved by creating

customer engagement at each online touch-point by implementing various customer engagement strategies. Fourth, as the finding suggested that trust in a website has a significant effect on online purchase intention, marketers should focus on enhancing online platform security to provide a safe and secure platform for transactions, 24/7 availability of a system, reliable information for products and services, effective aftersales services. These will positively contribute to and increases the trustworthiness of the online shopping environment.

6 Limitations and future research direction

The study was based on a rigorous meta-analysis methodology and sufficient to investigate the relationship between trust and online purchase intention but not without certain limitations. First, the study is based on a few studies to understand the relationship; therefore, results should be interpreted accordingly. Hence, Future research should include more studies to comprehensively understand the relationship. Second, the study considered trust as an independent variable and online purchase intention as a dependent variable. Though, other variables also affect online purchase intention. Future studies should consider other variables to develop a more inclusive picture of factors influencing online purchase intention. Third, the relationship between trust and online shopping intention is also influenced by other variables such as sample characteristics, sampling methodology, study location, and types of products/services that were not considered in the study and should be considered in the future research scope.

7 Conclusions

The study concludes that trust has a positive influence and stronger effect size on online purchase intention. The study also found that the types of trust do not affect this relationship. Both trust in e-retailers and trust in the website were positively associated with online purchase intention. However, trust in e-retailer has a stronger effect size than trust in website. Further, the relationship results did not change irrespective of online purchase intention, either initial or repeat. In both cases, trust and online purchase intention relationships are positively associated. Although, trust is more strongly associated with repeat purchase intention with a higher effect size than initial purchase intention. These results will help and attract a new perspective of research on the overall effect of trust on online purchase intention and optimistically promote and provide direction for future research.
